

SBS4115 Fundamentals of AI & Data Analytics

Introduction to Data Science

Department of Construction,
Environment and Engineering

Intended Learning Outcomes

- By the end of this lecture, you will be able to...
 - Explain what data science is
 - Characterize different types of data
 - Describe the data science process
 - Suggests applications of data analytics and artificial intelligence
 - Master computation tools for data science, e.g. Python and the Jupyter Notebook
 - Evaluate problems using Python.

What is Data Science?

- The term “**big data**” has become a hot topic in recent years due to the rapid growth in the size and scope of datasets in various sectors and advancement in technology.
- It refers to any collection of data sets so large or complex that is difficult to process using traditional data management techniques.
- The methods to analyze massive amounts of data and extract the information it contains is called **data science**.
- Both data science and big data evolved from statistics and traditional data management but are now considered to be distinct disciplines.

What is Data Science?

What is Data Science?

- The characteristics of big data are often referred to as the four V's:
 1. **Volume** - How much data is there?
 2. **Variety** - How diverse are different types of data?
 3. **Velocity** - At what speed is new data generated?
 4. **Veracity** - How accurate is the data?
- These four properties make big data different from the data found in traditional data management tools.
- Consequently, the challenges they bring can be felt in almost every aspect: data capture, curation, storage, search, sharing, transfer, and visualization.
- In addition, big data calls for specialized techniques to extract the insights.

What is Data Science?

- Data science and big data are used almost everywhere in both commercial and non-commercial settings.
- Commercial companies in almost every industry use data science and big data to gain insights into their customers, processes, staff, completion, and products.
- Many companies use data science to offer customers a better user experience, as well as to cross-sell, up-sell, and personalize their offerings.

Bloomberg

What is Data Science?

- Governmental organizations are also aware of data's value.
- Many governmental organizations not only rely on internal data scientists to discover valuable information, but also share their data with the public.
- You can use this data to gain insights or build data-driven applications.

DATA.GOV.HK

Types of Data

- In data science and big data, we will come across many different types of data.
- Each of them tends to require different tools and techniques.
- The **main categories of data** are:
 - a. Structured
 - b. Unstructured
 - c. Natural language
 - d. Machine-generated
 - e. Graph-based
 - f. Audio, video, and images
 - g. Streaming

*As an introductory course, we will focus on **structured data** which is more convenient for data analyzing and deploying algorithms in artificial intelligence. However, it would also be important to recognize other types of data for your future career in different disciplines.*

Types of Data

- **Structured data** is data that depends on a data model and resides in a fixed field within a record. As such, it is often easy to store structured data in tables within databases or Excel files.
 - SQL, or Structured Query Language, is the preferred way to manage and query data that resides in databases.
 - Hierarchical data such as a family tree is also structured but it is hard to store it in a traditional relational database.

| | A | B | C |
|---|-----|--------|--------|
| 1 | sex | height | weight |
| 2 | M | 1.73 | 65 |
| 3 | F | 1.61 | 54 |
| 4 | M | 1.8 | 72 |
| 5 | F | 1.56 | 63 |
| 6 | F | 1.69 | 58 |

| | sex | height | weight |
|---|-----|--------|--------|
| 0 | M | 1.73 | 65 |
| 1 | F | 1.61 | 54 |
| 2 | M | 1.80 | 72 |
| 3 | F | 1.56 | 63 |
| 4 | F | 1.69 | 58 |

Types of Data

- *Unstructured data* is data that is not easy to fit into a data model because the content is context-specific or varying.

- Examples of unstructured data include regular emails and posts on social media.
- Although email contains structured elements such as the sender, title, and body text, it is difficult to analyze the context of the email due to the variety in language.
- Similarly, it is complicated to analyze the context of a post on social media due to use of different symbols and emoticons.

Types of Data

- *Natural language* is a special type of unstructured data.
 - It poses some challenges to process because it requires knowledge of specific data science techniques and linguistics.

- The natural language processing community has had success in entity recognition, topic recognition, summarization, text completion, and sentiment analysis, but models trained in one domain do not generalize well to other domains.

Types of Data

- *Machine-generated data* is information that is automatically created by a computer, process, application, or other machine without human intervention.

- Machine-generated data is becoming a major data resource and will continue to do so.
- The analysis of machine data relies on highly scalable tools, due to its high volume and speed.
- Examples of machine data are web server logs, call detail records, network event logs, and telemetry.

Types of Data

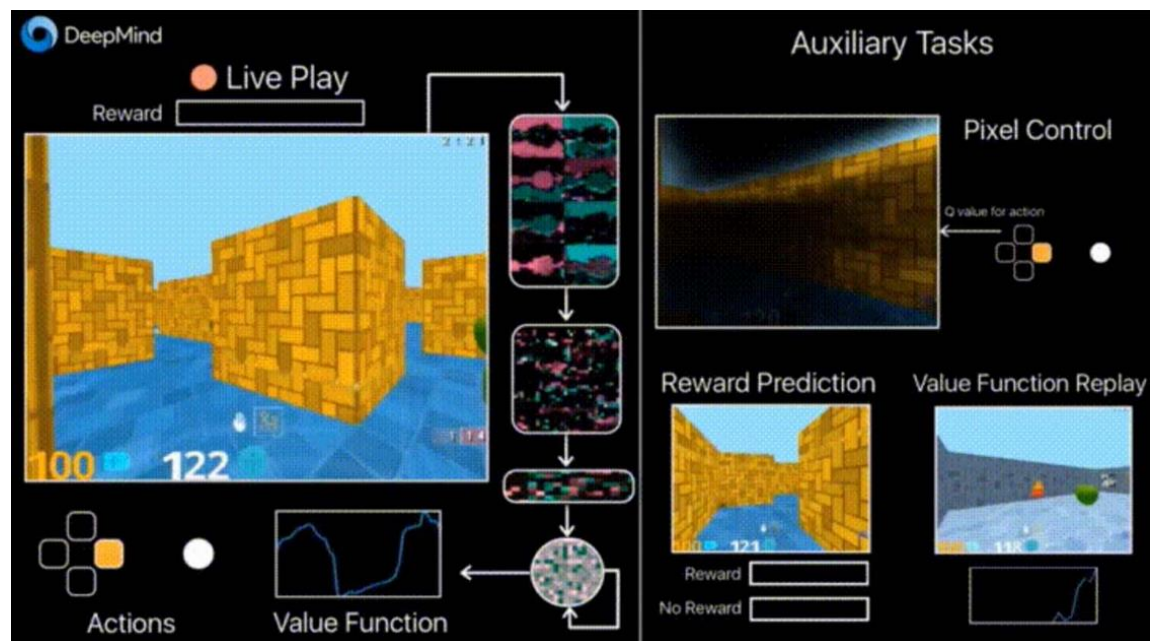

- *Graph-based or network data* is data that focuses on the relationship or adjacency of objects. The graph structures use nodes, edges, and properties to represent and store graphical data.
- Graph-based data is a natural way to represent social networks, and its structure allows you to calculate specific metrics such as the influence of a person and the shortest path between two people.
- Examples of graph-based data can be found on many social media websites such as Twitter and LinkedIn.

Types of Data

- *Audio, image, and video* are data types that pose specific challenges to a data scientist. Tasks that are trivial for humans, such as recognizing objects in pictures, turn out to be challenging for computers.

- For example, a company called DeepMind succeeded at creating an algorithm that is capable of learning how to play video games.
- This algorithm takes the video screen as input and learns to interpret everything via a complex process of deep learning.

Types of Data

- *Streaming data* can take almost any of the previous forms.
 - In addition, the data flows into the system when an event happens instead of being loaded into a data store in a batch.

- Although it is not quite a different type of data, streaming data is treated here as such because you need to adapt your process to deal with this type of information.
- Examples are live sporting or music events, and the stock market.

Data Science Process

- The data science process typically consists of **six steps**:
 1. Setting the research goal
 2. Data collection
 3. Data preparation
 4. Data exploration
 5. Data modelling
 6. Presentation and automation

6 STEPS

Data Science Process

1. Setting the research goal

- Data science is mostly applied in the context of an organization.
- When you are asked to perform a data science project, you will first prepare a project charter.
- This charter contains information such as what you are going to research, how the organization benefits from that, what data and resources you need, a timetable, and deliverables.

Data Science Process

2. Data collection

- The second step is to collect data.
- You have stated in the project charter which data you need and where you can find it.
- In this step, you ensure that you can use the data in your program, which means checking the existence, quality of, and access to the data.
- Data can also be delivered by third-party companies and takes many forms.

Data Science Process

3. Data preparation

- Data collection is an error-prone process; in this phase you enhance the quality of the data and prepare it for use in subsequent steps.
- This phase consists of **3 sub-phases**:

- i. data cleansing removes false values from a data source and inconsistencies across data sources;
- ii. data integration enriches data sources by combining information from multiple data sources;
- iii. data transformation ensures that the data is in a suitable format for use in your models.

Data Science Process

4. Data exploration

- Data exploration is concerned with building a deeper understanding of your data.
- You try to understand how variables interact with each other, the distribution of the data, and whether there are outliers.
- To achieve this you mainly use descriptive statistics, visual techniques, and simple modelling.

Data Science Process

5. Data modelling

- In this phase you use models, domain knowledge, and insights about the data you found in the previous steps to answer the research question.
- You select a technique from the fields of statistics, machine learning, operations research, and so on.

- Building a model is an iterative process that involves selecting the variables for the model, executing the model, and model diagnostics.

Data Science Process

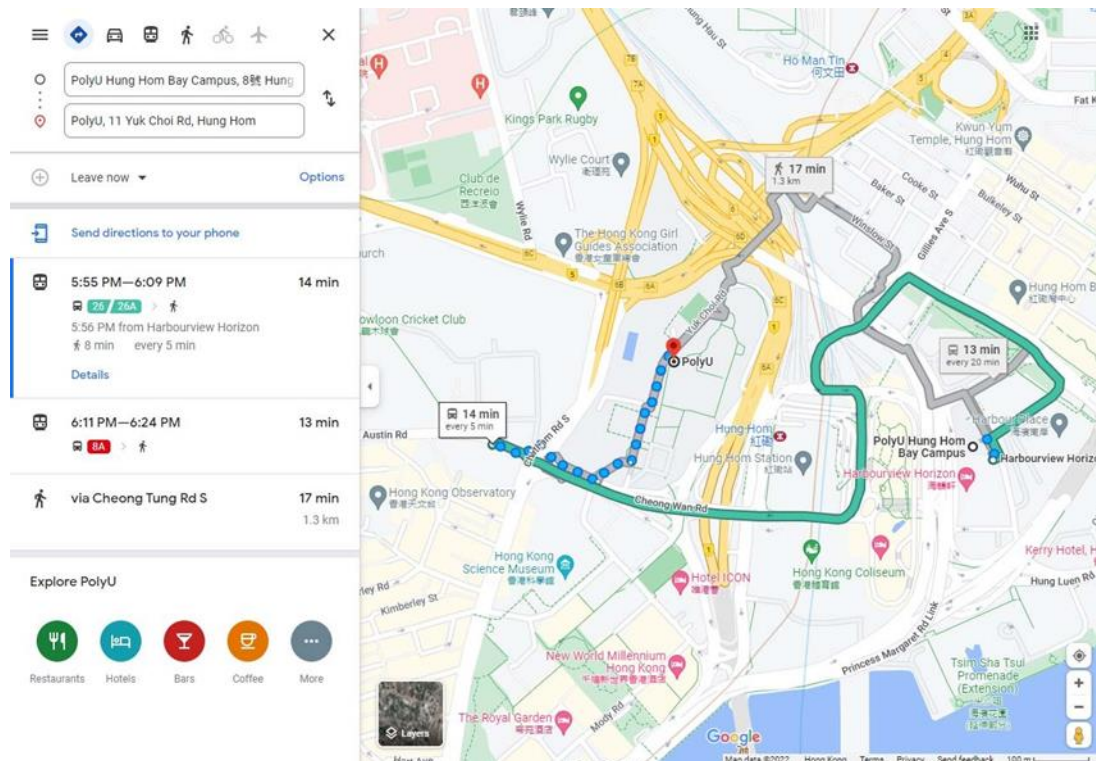

6. Presentation and automation

- Finally, you present the results.
- These results can take many forms, ranging from presentations to research reports.
- Sometimes you will need to automate the execution of the process because the business will want to use the insights you gained in another project or enable an operational process to use the outcome from your model.

Application

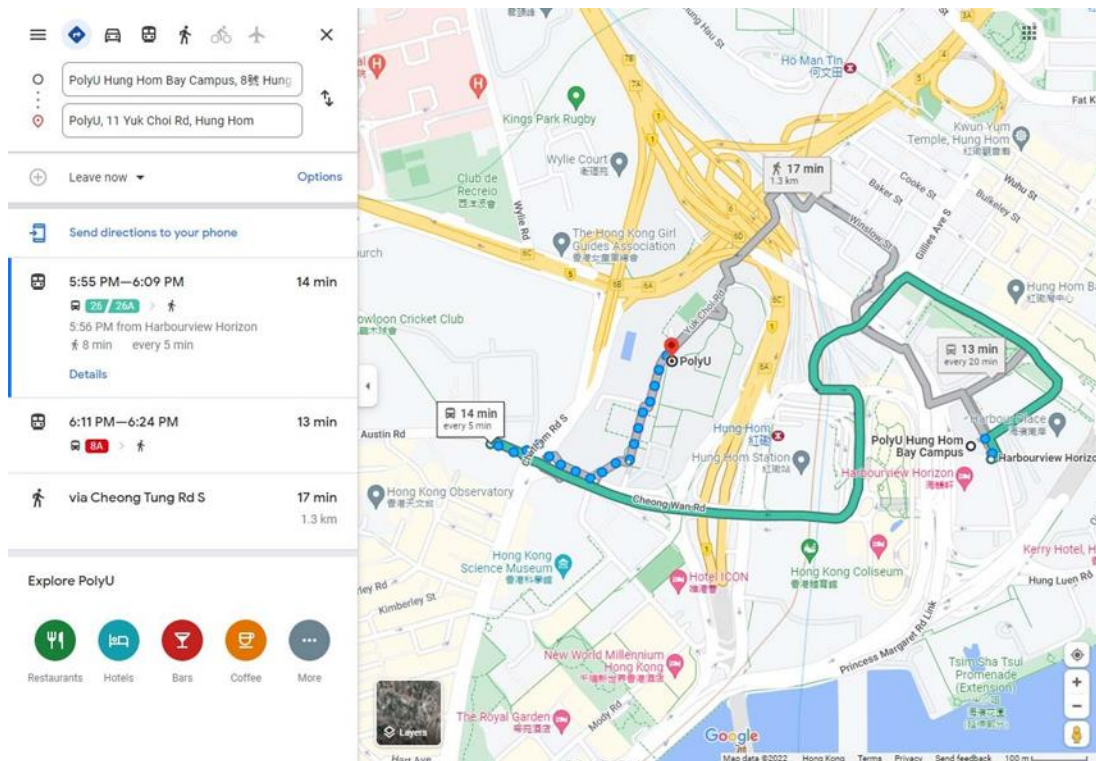

- After understanding the basic concepts of data science, we will look into some application of data analytics and artificial intelligence which make use of various types of data.

1. Map and traffic

- Travelling to a new destination does not require much thought any longer. Rather than relying on confusing address directions, we can now easily open our phone's map app and type in our destination.

Application

1. Map and traffic

- So how does the app know about the appropriate directions, best way, and even the presence of roadblocks and traffic jams?

Application

- **Artificial intelligence (AI)** now provides users with a much better experience in their unique surroundings.
- The app algorithm uses **machine learning** to recall the building's edges that are supplied into the system after the person has manually acknowledged them.
- This enables the map to provide simple visuals of buildings.
- Another feature is identifying and understanding handwritten house numbers, which assists travellers in finding the exact house they need.
- Their outline or handwritten label can also recognize locations that lack formal street signs.

Application

- The application has been trained to recognize and understand traffic.
- As a result, it suggests the best way to avoid traffic congestion and bottlenecks.
- The AI-based algorithm also informs users about the precise distance and time it will take them to arrive at their destination.
- It has been trained to calculate this based on the traffic situations.
- Several ride-hailing applications have emerged as a result of the use of similar AI technology.
- So, whenever you need to book a cab via an app by putting your location on a map, this is how it works.

Application

2. Face detection and recognition

- Utilizing face ID for unlocking our phones and using virtual filters on our faces while taking pictures are two uses of AI that are presently essential for our day-by-day lives.
- Face recognition is used in the former, which means that every human face can be recognized.

- Face recognition is used in the above, which recognizes a particular face.

Application

- Intelligent machines often match human potential: human babies begin to identifying facial features such as eyes, lips, nose, and face shapes.
- A face, though, is more than just that – a number of characteristics distinguish human faces.

- Smart machines are trained in order to recognize facial coordinates (x, y, w, and h; which form a square around the face as an area of interest), landmarks (nose, eyes, etc.), and alignment (geometric structures).
- This improves the human ability to identify faces by several factors.
- Face recognition is also used by government facilities or at the airport for monitoring, and security.

Application

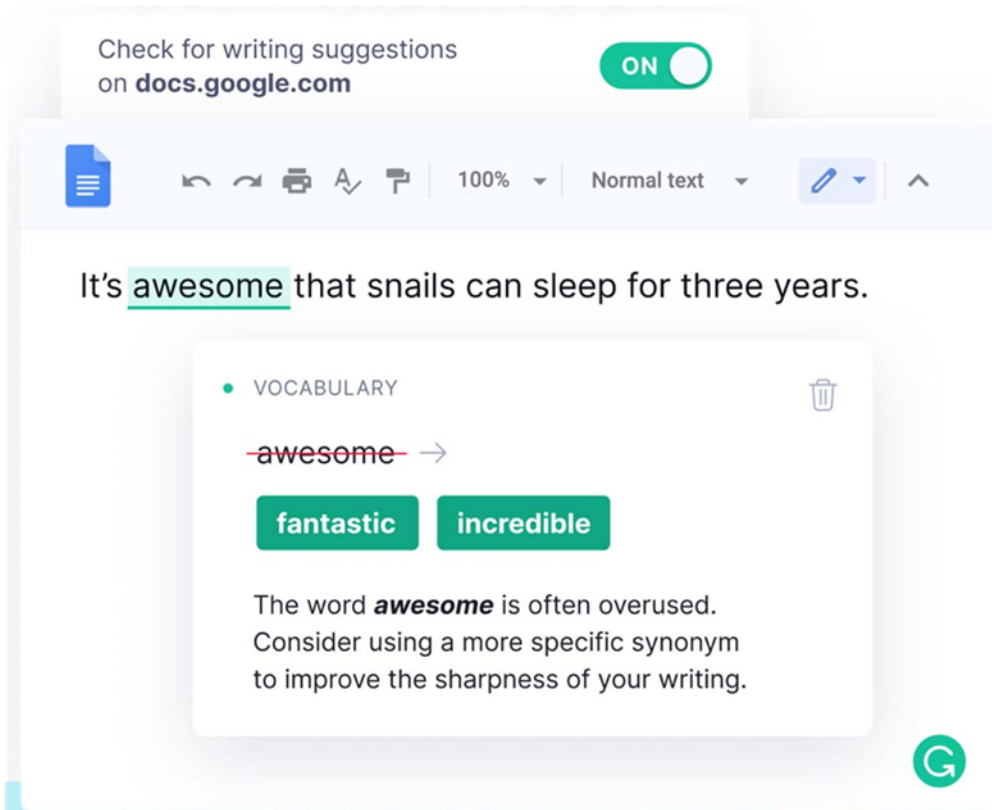

3. Text and language

- It takes a long time for us to master our language and become fluent in it.
- When typing a document, there are inbuilt or downloadable auto-correcting tools for editors of spelling errors, readability, mistakes, and plagiarism based on their difficulty level.
- Artificially intelligent algorithms often use deep learning, machine learning, and natural language in order to detect inappropriate language use and recommend improvements.
- Linguists and computer scientists collaborate in teaching machines grammar in the same way that we learned it in school.
- Machines are fed large volumes of high-quality data that has been structured in a way that machines can understand.
- Thus, when we misspell a single comma, the editor will highlight it in red and offer suggestions.

Application

- Launched in 2009, Grammarly is a cloud-based typing assistant that reviews spelling, grammar, punctuation, clarity, engagement, and delivery mistakes.

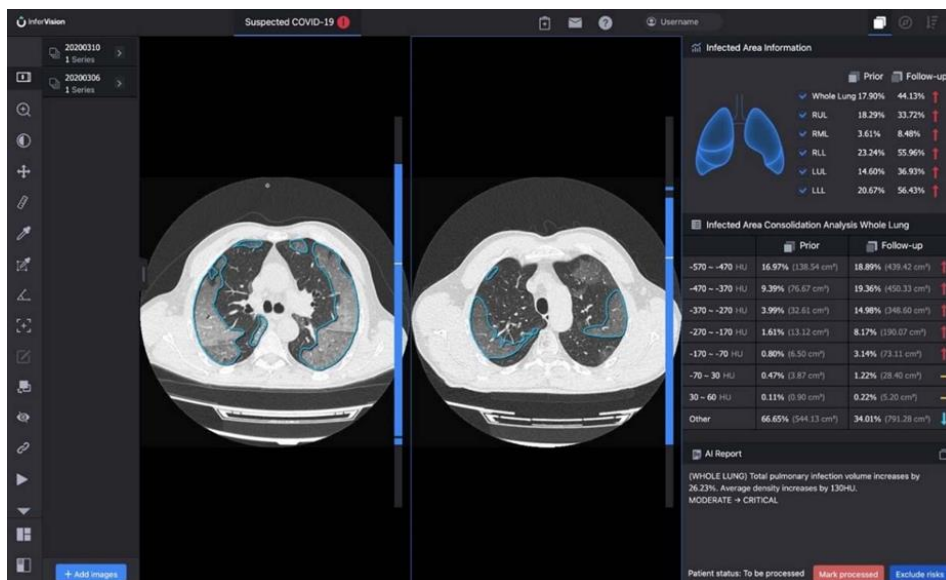

- It uses artificial intelligence to identify and search for an appropriate replacement for the error it locates.
- It also allows users to customize their style, tone, and context-specific language.
- It is available as a downloaded program for use with desktop applications, as a browser extension, and as a smartphone keyboard.

Application

4. Healthcare

- Infervision is using **artificial intelligence** and **deep learning** to save lives.
- In China, where there are insufficient radiologists to keep up with the demand for checking 1.4 billion CT scans each year for early symptoms of lung cancer.

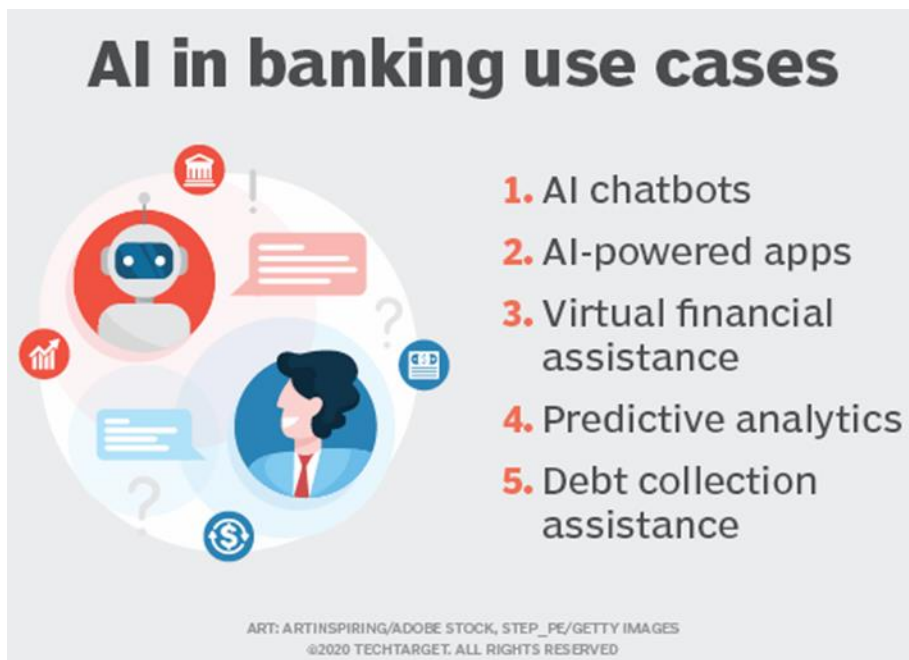

- Radiologists are required to review many scans every day, which is not just dreary, yet human weariness can prompt errors.
- Infervision trained and instructed algorithms to expand the work of radiologists in order to permit them to diagnose cancer more proficiently and correctly.

Application

5. Banking and finance

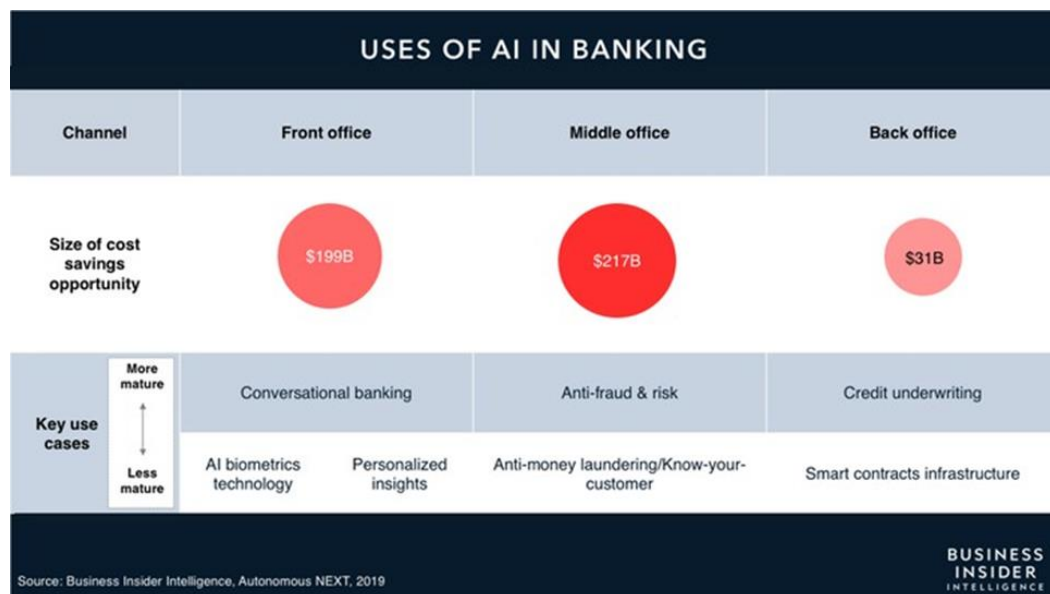

- The banking and finance industry has a major impact on our daily lives which means the world runs on liquidity, and banks are the gatekeepers who control the flow.

- Did you know that **artificial intelligence** is heavily used in the banking and finance industry for things such as customer service, investment, fraud protection, and so on?
- The automatic emails we get from banks if we make an ordinary transaction, are a simple example.

Application

- That's AI keeping an eye on our account and trying to alert us regarding any potential fraud.
- AI is now being trained to examine vast samples of fraud data in order to identify patterns so that we can be alerted before it happens to us.

- If we run into a snag and contact our bank's customer service, we are probably speaking with an **AI bot**.
- Even the largest financial industry uses AI to analyze data in order to find the best ways to invest capital in order to maximize returns while minimizing risk.

Computational Tools for Data Science

- Currently many big data tools and frameworks exist.
- The **big data ecosystem** can be grouped into technologies that have similar goals and functionalities.
- Data scientists use many different technologies, but not all of them.
- In this course, we will focus on the **Python programming language** and the **Jupyter Notebook** for developing the programs.

- Jupyter Notebook is an open source web application that allows users to manage, share, create, run programs written in Julia, python or R.

Computational Tools for Data Science

- A **computer program** is a collection of instructions executable by a computer to perform a specific task.
- **Computer programming** refers to the process of building a computer program.
- **Python** is a computer programming language with a standard set of numerical and data visualization tools that are used widely in commercial applications, scientific experiments, and open-source projects.

Computational Tools for Data Science

Computational Tools for Data Science

- **Jupyter Notebook** is a web-based application for creating and sharing computational documents.
- It offers a modern and powerful web interface to Python.
- To install, you may:
 - Step (1): download Anaconda (choose Python 3 version)
<https://docs.anaconda.com/anaconda/install/windows/>
 - Step (2): install Anaconda
 - Step (3): to run Jupyter notebook, type: jupyter notebook

You may follow the guidelines on the website for more details.

<https://test-jupyter.readthedocs.io/en/latest/install.html>

Structure

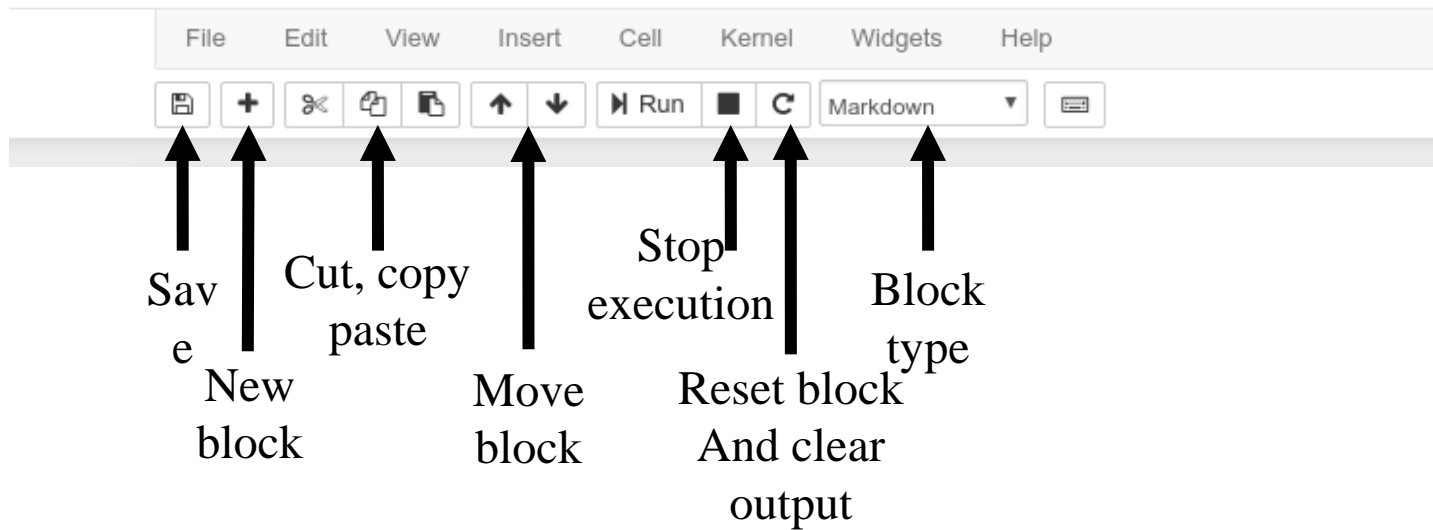

- NumPy (Numerical Python)
- pandas (Python Data Analysis Library)

Python today

- Developed a large and active scientific computing and data analysis community
- Now one of the most important languages for
 - Data science
 - Machine learning
 - General software development
- Packages: NumPy, pandas, matplotlib, SciPy, scikit-learn, statsmodels

4. Toolbar

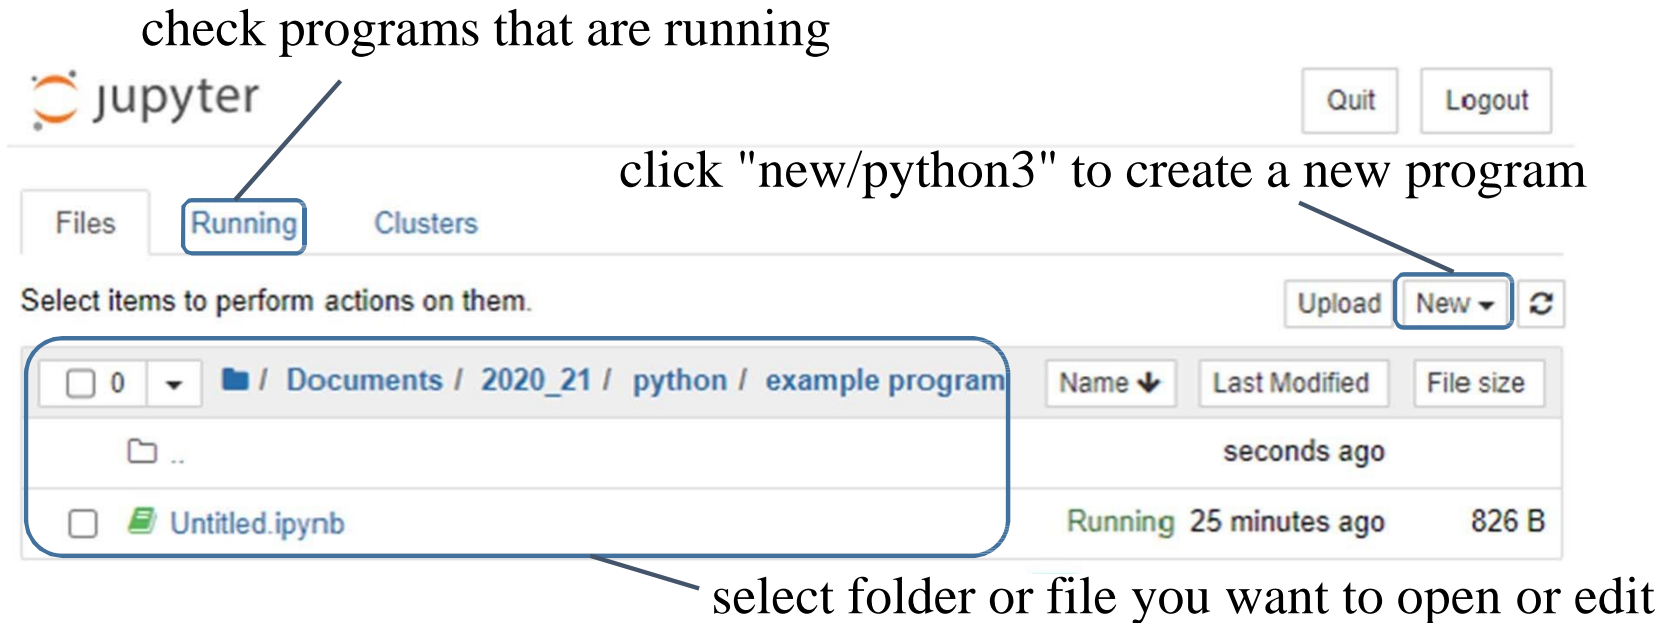

Computational Tools for Data Science

check programs that are running

click "new/python3" to create a new program

select folder or file you want to open or edit

The screenshot displays the JupyterLab web interface. At the top left is the Jupyter logo and the word 'jupyter'. To the right are 'Quit' and 'Logout' buttons. Below this is a navigation bar with 'Files', 'Running' (highlighted with a blue box and an arrow from the text 'check programs that are running'), and 'Clusters'. Below the navigation bar is a message 'Select items to perform actions on them.' and buttons for 'Upload', 'New' (highlighted with a blue box and an arrow from the text 'click "new/python3" to create a new program'), and a refresh icon. The main area shows a file browser with a path bar: '/ Documents / 2020_21 / python / example program'. Below the path bar is a table of files and folders:

| | Name | Last Modified | File size |
|--------------------------|----------------|------------------------|-----------|
| <input type="checkbox"/> | 0 | | |
| <input type="checkbox"/> | .. | seconds ago | |
| <input type="checkbox"/> | Untitled.ipynb | Running 25 minutes ago | 826 B |

The screenshot shows the Jupyter Notebook interface. At the top, the title bar says "jupyter Untitled Last Checkpoint: 28 minutes ago (autosaved)". Below it is a menu bar with "File", "Edit", "View", "Insert", "Cell", "Kernel", "Widgets", and "Help". To the right of the menu bar are buttons for "Trusted", a pencil icon, and "Python 3". A "Logout" button is in the top right corner. Below the menu bar is a toolbar with icons for saving, adding a new cell, deleting a cell, duplicating a cell, moving a cell up/down, running a cell, and other actions. A blue box highlights the first cell, labeled "In [1]". Inside this cell, the code `print("Welcome to python!")` is written. Below the code, the output "Welcome to python!" is displayed. A second cell, labeled "In []", is shown below the first, with a cursor in the input area. Annotations with arrows point to various parts: "panel for editing and running the cells" points to the toolbar; "indicates the first cell" points to the "In [1]" label; "coding in the first cell" points to the code line; "output corresponding to the first cell" points to the "Welcome to python!" output; and "the next input to be entered" points to the input area of the second cell.

panel for editing and running the cells

indicates the first cell

coding in the first cell

output corresponding to the first cell

the next input to be entered

- The advantage of using Jupyter Notebook is that it provides an interactive interface that allows user to view the outcome of the coding.
- Let's take a very simple example.
 - One might want to evaluate the result of the arithmetic operation $1+1$. Just type the coding on a cell and either click "Run" button or press Alt+Enter to execute the coding.

```
In [1]: 1+1
Out[1]: 2
```

Running blocks

- By pressing the Run button
- Shift + Enter – runs block
- Alt + Enter – creates a new block

Computational Tools for Data Science

- In Python, values can be stored as various data types such as:
 - `int` - positive/negative/zero integers
 - `float` - floating point real values
 - `str` - strings of multiple characters, enclosed by quotation marks
 - `bool` - Boolean which is either True (1) / False (0) for logical operations
- On Jupyter Notebook, you may try to execute some simple calculation using the arithmetic operators as follows:

| Operator | Name |
|---------------------|----------------|
| <code>+</code> | addition |
| <code>-</code> | subtraction |
| <code>*</code> | multiplication |
| <code>/</code> | division |
| <code>**</code> | exponent |
| <code>%</code> | modulus |
| <code>//</code> | floor division |
| <code>max(,)</code> | maximum |
| <code>min(,)</code> | minimum |

Computational Tools for Data Science

- A variable is a reserved location to store values.
- To assign a value to a variable, use the syntax:

```
variable_name = value_assigned
```

- For example, the coding below assigns the string 'ama' to x, the integer 123 to y, and the float number 1.23 to z. Click "Run" button or press Alt+Enter to execute the coding in a cell.

```
x = 'ama'  
y = 123  
z = 1.23
```

Computational Tools for Data Science

- In Jupyter Notebook, you may check the value of each variable by calling it.
- You may also check their data type using `type()`.

x

'ama'

`type(x)`

str

y

123

`type(y)`

int

z

1.23

`type(z)`

float

Exercise 1

1. Evaluate the result of the following python code:

```
x = 10
x = x + 1
print(x)
```

2. Evaluate the result of the following python code:

```
a = 'pine'
b = 'apple'
print(a+b)
```

3. What is the last digit of 7^{2024} ?
Try to evaluate by python **without directly calculating the results of 7^{2024}**

Data Structure

- **Data structure** is a storage that is used to store and organize data.
- It is a way of arranging data on a computer so that it can be accessed and updated efficiently.
- To store data sequentially in the memory, we can use an array data structure.
- **List** is a primitive data structure in Python.
- In later sections, we will also use array from the NumPy library and Series from the Pandas library which have similar data structure as list but come with more powerful features.

Data Structure

- In python, an array of numbers can be stored in various forms such as a list.
- A list is a collection of values which is ordered and changeable.
- To declare a list and assign values into it, we can list out the members separated by comma and enclosed in square brackets:

```
list_name = [member0, member1, member2, ...]
```

- Notice that each member is labelled by an index starting from 0 (instead of 1). To access a single member, we can use:

```
list_name[index]
```

Data Structure

- For example, we can create a list of numbers:

```
mylist = [2,3,5,7,11]
```

- The five values are stored in a sequential order with index 0 to 4.

| | | | | | |
|--------|---|---|---|---|----|
| mylist | 2 | 3 | 5 | 7 | 11 |
| index | 0 | 1 | 2 | 3 | 4 |

- If we access the member with index 2 in `mylist`, it gives:

```
mylist[2]
```

5

Data Structure

- To create a sliced list with consecutive members in the original list, we can use:

```
list_name[starting_index:stopping_index]
```

- Notice that the term represented by the stopping index is not included in the sliced list.
- For example, if we form a sliced list from `mylist` with starting index 1 and stopping index 4:

```
mylist[1:4]
```

```
[3, 5, 7]
```

Data Structure

- The result is another list formed by elements in `mylist` with index 1, 2, 3.

| | | | | | |
|--------|---|---|---|---|----|
| mylist | 2 | 3 | 5 | 7 | 11 |
| index | 0 | 1 | 2 | 3 | 4 |

Exercise 2

1. Evaluate the result of the following python coding.

```
fruits = ['apple', 'banana', 'cherry']  
print(fruits[1])
```

2. Evaluate the result of the following python coding.

```
x = [4, 2, 0, 3, 1]  
print(x[x[x[4]]])
```

3. The list y below is formed by 10 lower letters. A new list z is formed by slicing. Evaluate the result to find z.

```
y = ['a', 'b', 'c', 'd', 'e', 'f', 'g', 'h', 'i', 'j']  
z = y[3:7]  
print(z)
```

Adding and removing elements

- `xs = ['apple', 'pineapple']` # Can contain elements of different types
- `print(xs)`
- `xs.append('orange')` # Add a new element to the end of the list
- `print(xs)`
- `xs.pop(1)`

Try and see what happen

Exercise 3

Instructions:

1. Create a list of your favorite 3 fruits.
2. Output the first and last fruit in the list.
3. Add a new fruit to the end of the list.
4. Remove the second fruit from the list.
5. Output the updated list.

James Bond movie data

| Film | Year | Actor | Director | Box Office | Budget | Bond Actor Salary |
|---------------------------------|------|----------------|--------------------|------------|--------|-------------------|
| Dr. No | 1962 | Sean Connery | Terence Young | 448.8 | 7 | 0.6 |
| From Russia with Love | 1963 | Sean Connery | Terence Young | 543.8 | 12.6 | 1.6 |
| Goldfinger | 1964 | Sean Connery | Guy Hamilton | 820.4 | 18.6 | 3.2 |
| Thunderball | 1965 | Sean Connery | Terence Young | 848.1 | 41.9 | 4.7 |
| Casino Royale | 1967 | David Niven | Ken Hughes | 315 | 85 | |
| You Only Live Twice | 1967 | Sean Connery | Lewis Gilbert | 514.2 | 59.9 | 4.4 |
| On Her Majesty's Secret Service | 1969 | George Lazenby | Peter R. Hunt | 291.5 | 37.3 | 0.6 |
| Diamonds Are Forever | 1971 | Sean Connery | Guy Hamilton | 442.5 | 34.7 | 5.8 |
| Live and Let Die | 1973 | Roger Moore | Guy Hamilton | 460.3 | 30.8 | |
| The Man with the Golden Gun | 1974 | Roger Moore | Guy Hamilton | 334 | 27.7 | |
| The Spy Who Loved Me | 1977 | Roger Moore | Lewis Gilbert | 533 | 45.1 | |
| Moonraker | 1979 | Roger Moore | Lewis Gilbert | 535 | 91.5 | |
| For Your Eyes Only | 1981 | Roger Moore | John Glen | 449.4 | 60.2 | |
| Never Say Never Again | 1983 | Sean Connery | Irvin Kershner | 380 | 86 | |
| Octopussy | 1983 | Roger Moore | John Glen | 373.8 | 53.9 | 7.8 |
| A View to a Kill | 1985 | Roger Moore | John Glen | 275.2 | 54.5 | 9.1 |
| The Living Daylights | 1987 | Timothy Dalton | John Glen | 313.5 | 68.8 | 5.2 |
| Licence to Kill | 1989 | Timothy Dalton | John Glen | 250.9 | 56.7 | 7.9 |
| GoldenEye | 1995 | Pierce Brosnan | Martin Campbell | 518.5 | 76.9 | 5.1 |
| Tomorrow Never Dies | 1997 | Pierce Brosnan | Roger Spottiswoode | 463.2 | 133.9 | 10 |
| The World Is Not Enough | 1999 | Pierce Brosnan | Michael Apted | 439.5 | 158.3 | 13.5 |
| Die Another Day | 2002 | Pierce Brosnan | Lee Tamahori | 465.4 | 154.2 | 17.9 |
| Casino Royale | 2006 | Daniel Craig | Martin Campbell | 581.5 | 145.3 | 3.3 |
| Quantum of Solace | 2008 | Daniel Craig | Marc Forster | 514.2 | 181.4 | 8.1 |
| Skyfall | 2012 | Daniel Craig | Sam Mendes | 943.5 | 170.2 | 14.5 |
| Spectre | 2015 | Daniel Craig | Sam Mendes | 726.7 | 206.3 | |

Simple analysis by plotting graphs

First, we need to import the file

```
import pandas as pd
```

```
jamesbondlist = pd.read_csv(r"C:\Users\User  
user\Desktop\jamesbond.csv", header=None)
```

```
print(jamesbondlist)
```

Simple analysis by plotting graphs

For simple usage, we can convert the file into an array

```
# Converting the DataFrame to a NumPy array
```

```
jamesbondarray = jamesbondlist.to_numpy()
```

```
# Printing the array
```

```
print(jamesbondarray)
```

```
# Checking the type of the array
```

```
print(type(jamesbondarray))
```

Plotting the graph

```
import matplotlib.pyplot as plt
```

```
# Extracting the 'Year' and 'Budget' columns from the array
```

```
years = jamesbondarray [1:, 1].astype(int)          # 'Year' is in the second column
```

```
budgets = jamesbondarray[1:, 5].astype(float)      # 'Budget' is the sixth column
```

Plotting the graph

Plotting the data

`plt.plot(years, budgets, marker='o')` #the markers should be circles.

`plt.title('James Bond Films: Year vs. Budget')`

`plt.xlabel('Year')`

`plt.ylabel('Budget (in million USD)')`

`plt.grid(True)`

Checklist

- Can you:
 1. Explain what data science is?
 2. Characterize different types of data?
 3. Describe the data science process?
 4. Suggests applications of data analytics and artificial intelligence?
 5. Master computation tools for data science, e.g. Python and the Jupyter Notebook?
 6. Evaluate problems using Python?
